

PetPal - Usability Report

Report by: Richard Duong & Andrew Tan

User	Task 1 (Adding a pet)	Task 2 (Adding a task)	Task 3 (Upload + store docs)
User 1	✓	✓	✓
User 2	✓	✓	✗
User 3	✓	✓	✗

User	Overall Feedback
User 1	- This user immediately praised the clean, easy-to-navigate design, and overall userflow of the wireframe. - One of the critiques given were several but minor inconsistencies with the site's overall iconography (need more custom ones rather than emojis), component settings, and layout (such as padding and text sizes).
User 2	- The user liked the theme of the website. Colors are soft and represent the brand well. - All tasks were completed, but took the user a while to find the place and understand how the document(s) upload section functioned. - The user pointed out that there should be an upload section in the Documentation tab of the Health page as well (rather than just the medical history). - Recommended implementing a slider for testimonials in the About Us page to further affect conversion rates. - Recommended adding exit buttons for all modals. "Developers should not assume users know to click outside to exit out the overlay."
User 3	- Same as user 2, the user did not initially understand where to look for document upload or how it worked. - Recommended the addition of a question mark button that serves as a UI tooltip, helping users further understand the functionality of the website. - Would've liked to have seen the Pricings and Notifications page to be fully implemented. - Pointed out that while a website for desktop viewport is nice, that we should have prioritized the mobile viewport because mobile devices are more accessible and commonly used for task management.

In Summary

Users generally found the interface clean, easy to navigate, and visually consistent with a soft, well-received color scheme, but noted several usability gaps. Common issues included minor inconsistencies in icons and spacing, confusion around the document upload feature (its location and functionality), and the need for clearer affordances such as visible exit buttons on modals and helpful tooltips. Users also recommended improving feature completeness (e.g pricing and notifications pages), and enhancing engagement with elements like testimonials. Additionally, they emphasized prioritizing mobile responsiveness and improving overall clarity and guidance within the interface.
